English possible contribution of the longitudinal studies. Project title in Italian Il legame mancante trale prime abilità sociali nell'infanzia e lo sviluppo della Teoria della Mente in età successive: il possibile contributo degli studi longitudinali. Subject area of reference (World University Ranking) SOCIAL SCIENCES (inc. Education, Law, Politics & International Studies, Sociology, Psychology, Geography) Project summary and VPS' profile The roots of Theory of Mind abilities can be identified in early infancy when children begin to comprehend actions in terms of intentions and share their interest in objects and events in contexts of shared attention with others. Theory of Mind continues to evolve throughout one's life, facilitated by the development of recursive thinking at increasing levels of complexity, the influence of language, and executive functioning, all of which mediate interactions during socio-communicative exchanges. However, longitudinal studies capable of demonstrating actual developmental continuity among various processes are still rare, and the results do not all point in the same direction. This project alms to define the possible link between early social abilities and later Theory of Mind development, through the analysis of the data gathered from longitudinal studies from infancy to childhood and even to later ages and outstanding worldwide experience in significant shift in Theory of Mind (ToM) skills, typically emerging around the age of four. This ability has been extensively investigated in the literature through the unexpected transfer task (Wimmer, Perner, 1983). To achieve this aim, we will call a Visiting Professor with long-lasting experience in longitudinal studies from infancy to childhood and even to later ages and outstanding worldwide experience in developing successful resea		Loredana Lucarelli
Italian successive: il possibile contributo degli studi longitudinali. Subject area of reference (World University Ranking) SOCIAL SCIENCES (inc. Education, Law, Politics & International Studies, Sociology, Psychology, Geography) Project summary and VPS' profile The roots of Theory of Mind abilities can be identified in early infancy when children begin to comprehend actions in terms of intentions and share their interest in objects and events in contexts of shared attention with others. Theory of Mind continues to evolve throughout one's life, facilitated by the development of recursive thinking at increasing levels of complexity, the influence of language, and executive functioning, all of which mediate interactions during socio-communicative exchanges. However, longitudinal studies capable of demonstrating actual developmental continuity among various processes are still rare, and the results do not all point in the same direction. This project aims to define the possible link between early social abilities and later Theory of Mind development of the data gathered from longitudinal studies from infancy to childhood and even later, run at the University of Cagliari and in other Universities that will collaborate at the project. Specifically, we will focus on the understanding of False Belief, which represents a significant shift in Theory of Mind (ToM) skills, typically emerging around the age of four. This ability has been extensively investigated in the literature through the unexpected transfer task (Wimmer, Perner, 1983). To achieve this aim, we will call a Visiting Professor with long-lasting experience in longitudinal studies from infancy to childhood and even to later ages and outstanding worldwide experience in developing successful research projects to study the developmental perspective.
